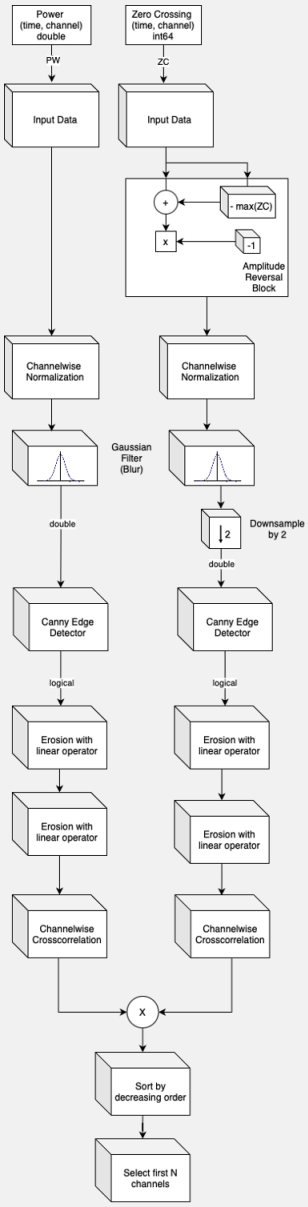
Industry Experience

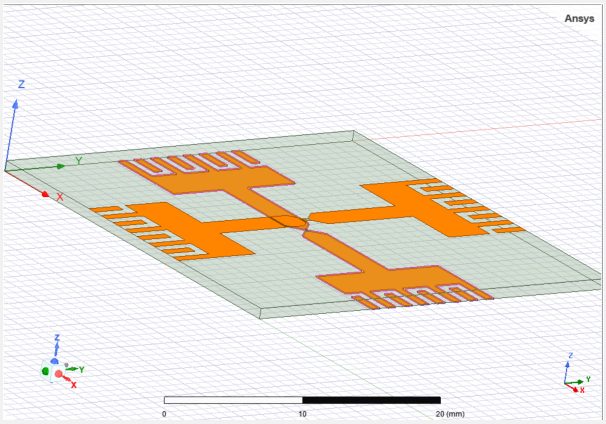
2021 April - 2022 June | Part-Time Signal Processing Engineer in NANOTAM

During my work on processing OTDR data, I utilized classical and efficient signal processing techniques with MATLAB, Python, and C++. I researched the use of chirped pulses as the probing signal for phi-OTDR, calculated the noise profile of the ADC and DAC modules in various projects, and programmed an Nvidia Jetson board for specific computer vision applications. Additionally, I designed a real-time signal processing pipeline in MATLAB for phi-OTDR event detection.

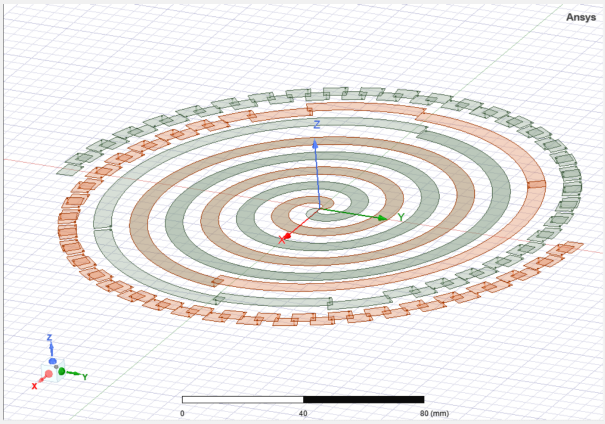


2022 July - August | Summer Internship in ASELSAN

During my internship in the Antenna Design Group, I successfully designed wideband antennas that met specific requirements using Ansys HFSS software. My responsibilities included optimizing the physical dimensions and selecting appropriate superstrate materials for an array antenna.

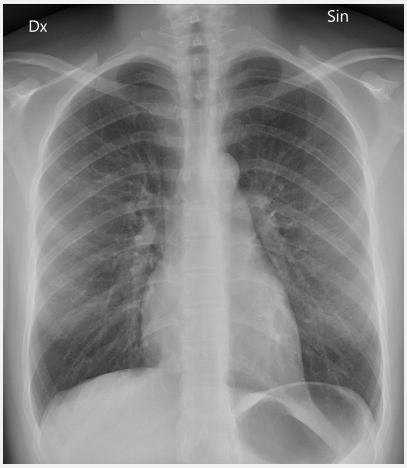


Furthermore, I designed a meandered spiral Archimedean antenna tailored for a specified frequency range, ensuring optimal performance and efficiency.



2021 June - July | Summer Internship in UMRAM

During my summer internship at UMRAM, I focused on several key projects. I conducted extensive research on deep learning models for computer vision, designed medical X-ray image classifiers using transfer learning techniques with backbone models like EfficientNet, ResNet, and Inception, and developed a robust classifier model for detecting monkeypox disease from image data.



Research Experience

2024 Sep - Present | Undergraduate Researcher in Biomedical Imaging Group

BİLKENT ÜNİVERSİTESİ NANOTAM
